

CUSTOMER & MVP BLUEPRINT

NIRIKSHAK AI

Derived from the Startup Validation Report · September 2026

01 Executive Summary

NIRIKSHAK AI applies OCR and computer vision to verify packaged-commodity labels against India's Legal Metrology (Packaged Commodities) Rules, 2011/2026. The core problem — slow, inconsistent manual label inspection amid rising regulatory complexity — is real, but the chosen primary buyer (government Legal Metrology departments) is slow-paying and procurement-heavy. This Blueprint translates that validated problem into a concrete, buildable MVP and a 30-day customer-discovery and build plan, spanning both the government track and a faster-moving B2B compliance-SaaS track.

02 Ideal Customer Profile

Attribute	Primary ICP (Government)	Secondary ICP (B2B)
Org type	State Legal Metrology Directorate / district office	Mid-size FMCG, cosmetics, or D2C brand/importer
Size	20–300 field inspectors per state	₹5–200 Cr revenue; 1–5 person compliance team
Trigger	New mandate, audit failure, digitization push	Recall scare, delisting, SKU launch, LMPC renewal
Sales cycle	12–24 months, tender/RFP or pilot route	2–8 weeks, direct SaaS trial
Pay-readiness today	Low-moderate; needs pilot proof	Moderate-high; self-funded, immediate pain

03 Buyer Persona

"Inspector Raghunath" — Government

- Legal Metrology Inspector, 8–15 yrs service. Measured on inspections completed and appeal-proof findings.
- Wants: less time per inspection, defensible digital evidence, no extra procurement burden on him personally.

"Priya" — Compliance Lead, FMCG/D2C

- Quality/Compliance Manager. Measured on zero recalls/penalties and fast SKU launch.
- Wants: self-serve pass/fail check per SKU label in minutes, no government sales cycle.

04 Top 10 Customer Pain Points

#	Pain Point	Segment
1	Manual label review is slow and inconsistent across inspectors/states	Govt
2	No standardized digital evidence trail for enforcement actions	Govt
3	Rising regulatory complexity (2026 e-commerce COO rule) outpaces manual capacity	Govt
4	No audit trail to defend findings on appeal	Govt
5	Inspectors lack a mobile/field-friendly tool (existing vision tools assume factory line)	Govt
6	Risk of penalty/recall from missed label errors across large SKU catalogs	B2B
7	No affordable self-check tool for SMEs before print run	B2B

#	Pain Point	Segment
8	Cross-jurisdiction label variance (state + export rules) hard to track manually	B2B
9	New-SKU launches delayed by manual compliance sign-off	B2B
10	No general-purpose (cross-brand) label checker — only single-brand "golden template" tools exist	Both

05 Customer Journey

Stage	Government	B2B
Awareness	Hackathon demo, GeM listing, word-of-mouth	Search, LinkedIn, referral, compliance content
Consideration	Informal demo, legal-defensibility review	Free trial on 1–2 SKUs vs. manual QA cost
Purchase	MoU pilot → tender/GeM order (6–18 mo)	Standard SaaS PO (days–weeks)
Retention	Statewide rollout if pilot succeeds	Expansion across SKU lines; annual renewal

06 Key Customer Objections

- "Our manual process works well enough — why change now?"
- "Is an AI finding legally defensible / admissible as evidence?" (Govt)
- "Will this run on approved government infrastructure / data security?" (Govt)
- "No budget outside the annual procurement cycle." (Govt)
- "Will this integrate with our existing QMS?" (B2B)

07 Key Buying Triggers

- New regulatory deadline (e.g., 1 July 2026 e-commerce COO rule)
- High-profile penalty/recall raising internal pressure to act
- GeM Startup Runway / innovation-challenge low-friction entry point
- (B2B) New SKU launch, delisting threat, or LMPC renewal

08 MVP Recommendation

Build first

- A single-workflow tool: upload/capture a label photo → OCR extracts declared fields → rule engine flags pass/fail against LMPC mandatory declarations, with a confidence score and a plain-language reason.
- A lightweight case/evidence log (photo + OCR output + rule match + timestamp) exportable as PDF — this is the feature both an inspector and a compliance lead independently need.

Do NOT build yet

- Full multi-agent inspection workflow, statewide dashboards, or integrations with government IT systems — no confirmed buyer for this scope yet.
- Custom rule engines for FSSAI, BIS, or export-market labeling — validate the core LMPC use case first.

Success metrics (first 30–60 days)

- ≥10 structured interviews completed with inspectors + compliance leads
- ≥2 pilot commitments (1 govt MoU or 1 paid/free B2B trial minimum)
- ≥80% label-check accuracy against manually-verified test set

09 MoSCoW Prioritization

Priority	Items
Must Have	Photo upload/capture; OCR field extraction; LMPC rule-check engine; pass/fail + reason output; exportable evidence log
Should Have	Batch upload for multiple SKUs; confidence scoring; basic user accounts
Could Have	Mobile app (vs. web); multi-language label OCR (Hindi + regional); analytics dashboard
Won't Have (for now)	Government IT integrations; FSSAI/BIS/export rule engines; multi-agent workflow automation

10 Pricing Hypothesis

Segment	Model	Indicative Price
Government pilot	Per-district/state MoU or small pilot contract	₹15–40L per pilot (6–12 months)
B2B self-serve	Per-SKU or per-seat SaaS subscription	₹15,000–60,000/year per brand (tiered by SKU volume)

Pricing is a starting hypothesis to test in discovery calls, not a fixed rate card.

11 Top 5 Risks

Risk	Mitigation
Govt sales cycle exhausts runway before first contract	Run B2B pilot in parallel for faster revenue/learning
No paying customers/LOIs yet	Complete 10–15 structured interviews before further build
Solo-founder bandwidth	Recruit advisor/co-founder with govt or regulatory network
Data access/hosting restrictions in govt pilots	Design for on-prem/offline-capable deployment early
Incumbent QA vendors move into this niche	Move fast on India-specific, field-mobile, regulator-facing angle

12 30-Day MVP Plan

Week	Focus
1	Interview 5–8 inspectors + 5–8 compliance leads; confirm pain, workflow, and willingness to pilot
2	Scope MVP to single workflow (label photo → pass/fail + reason); write 1-page brief per segment
3	Build clickable MVP; secure 1–2 govt MoU pilots and 2–3 B2B trial commitments
4	Test MVP against real labels; score accuracy; decide govt vs. B2B vs. both for next 90 days

13 Founder Action Sheet

- 1. List and contact 10–15 inspectors/compliance leads for interviews this week
- 2. Draft a 5-question discovery script focused on current workflow and cost of errors
- 3. Convert the SIH prototype into a single-workflow clickable demo
- 4. Identify 2 states with active digitization pushes for a warm pilot approach
- 5. Identify 5 SME/D2C brands as B2B trial targets
- 6. Register on GeM Startup Runway / DPIIT Startup India
- 7. Build a labeled test dataset (real label photos) to measure OCR/rule accuracy

- 8. Draft pricing one-pagers for both segments to use in calls
- 9. Set a hard go/no-go checkpoint for Day 30 based on interview + pilot results
- 10. Identify 1 advisor/co-founder candidate with govt-sales or regulatory-affairs background

14 Scores (0–100)

Customer Clarity		55/100
Problem Severity		70/100
PMF Potential		50/100
MVP Readiness		60/100

Scores reflect a credible, well-scoped problem with strong technical readiness, held back by zero direct customer validation to date.

15 Final Verdict

PROMISING BUT UNVALIDATED

- The problem is real and technically addressable; the MVP scope above is buildable in 30 days.
- No customer interviews, LOIs, or pilots exist yet — the verdict moves to  only after Week 1–2 discovery calls confirm willingness to pilot/pay.
